Search resources

```
add_media_page( string $page_title, string $menu_title, string $capability,
string $menu_slug, callable $callback = "", int $position = null ): string|false
```

Adds a submenu page to the Media main menu.

### Description

This function takes a capability which will be used to determine whether or not a page is included in the menu.

The function which is hooked in to handle the output of the page must check that the user has the required capability as well.

### Parameters

`$page_title`**string**required

The text to be displayed in the title tags of the page when the menu is selected.

`$menu_title`**string**required

The text to be used for the menu.

`$capability`**string**required

The capability required for this menu to be displayed to the user.

`$menu_slug`**string**required

The slug name to refer to this menu by (should be unique for this menu).

`$callback`**callable**optional

The function to be called to output the content for this page.

Default: ''

`$position`**int**optional

The position in the menu order this item should appear.

Default: null

### Return

**string|false** The resulting page's hook\_suffix, or false if the user does not have the capability required.

### More Information

Usage:

`wp-admin/includes/plugin.php`[Copy](#)

```
add_media_page( $page_title, $menu_title, $capability, $menu_slug, $function);
```

Notes:

- If you're running into the »You do not have sufficient permissions to access this page.« message in a `wp_die()` screen, then you've hooked too early. The hook you should use is `admin_menu`.
- This function is a simple wrapper for a call to `add_submenu_page()`, passing the received arguments and specifying 'upload.php' as the `$parent_slug` argument. This means the new page will be added as a sub-menu to the Media menu.
- The `$capability` parameter is used to determine whether or not the page is included in the menu based on the [Roles and Capabilities](#) of the current user.
- The function handling the output of the options page should also verify the user's capabilities.

Source

wp-admin/includes/plugin.php

Copy

```
function add_media_page( $page_title, $menu_title, $capability, $menu_slug, $callback = '', $position = null ) {
    return add_submenu_page( 'upload.php', $page_title, $menu_title, $capability, $menu_slug, $callback, $position );
}
```

^ -2 v

Example

Typical usage occurs in a function registered with the 'admin\_menu' hook (see Adding Administration Menus):

Copy

```
function wpdocs_my_plugin_menu() {
    add_media_page(
        __( 'My Plugin Media', 'textdomain' ),
```

```
__ ( 'My Plugin', 'textdomain' ),
    'read',
    'my-unique-identifier',
    'wpdocs_my_plugin_function'
);
}
add_action( 'admin_menu', 'wpdocs_my_plugin_menu' );
```
